## C-STAR COMPOST Starter and Enhancer

C-Star Compost Starter enhances the composting process for improved process and enriched final compost. It evens out the starting time and running temperature for better weed and pathogen control. During the composting process C-Star enhances the microbes that incorporates ammonium nitrogen present in manure into organic compounds. It helps conserve and fix nitrogen in the composting process, increase plant available phosphorus and creates quality humic fractions.

**SHAKE CONTAINER WELL PRIOR TO USE**

### DIRECTIONS

Use at the rate of 250–300ml/metric ton per ton of organic wastes to be composted. Mix C-Star with water at 1:15. Do not mix with chemicals.

### Starting the Compost

- Dilute the activated C-Star with water to the needed level.
  - Moisture within the pile will need to range between 45% – 65%. Highest decomposition is usually achieved with 55% moisture and 50% air per volume. Approximate mass will be 500 kg per cubic meter.
  - Apply activated C-Star uniformly with the organic wastes to be composted.
  - Place the mixed material into piles or windrows in a covered area to protect from rain, with the ground surface well packed and drained. The height of the pile or windrow should be between 150cm – 210cm (5–7ft).
- This product is distributed by a certified Metagen agronomist. Consult with your agronomist for specific application instructions for your crop. Ideal timing, rates and method of application can vary across systems.
