## DIGESTOR CHALLENGE

High pH and Sodic Soils

Digestor Challenge is an advanced microbial soil treatment formulated to handle the challenge of sodic soils in Australia. It works with species of biology that can operate in this higher pH and higher sodium environment. Digestor Challenge is formulated to improve nutrient availability, nitrogen cycling and phosphorus release in high PH soils. It builds soil humus - improving soil structure, rooting depth and water infiltration.

**SHAKE CONTAINER WELL PRIOR TO USE**

### APPLICATION RATE

Digestor Challenge is always applied together with its activator Green Carbon Activate. They are applied at equal rates.

Recommended rate: 2-3 litre/hectare. The rate depends on your crop type and crop health. Apply as advised by your agronomist.

Mix Digestor Challenge and Green Carbon Activate together into water and apply in the same pass. Always apply with moisture or during moist conditions. Dechlorinate water if using chlorinated town water.

### APPLICATION METHODS

- Via irrigation. Pressure should be below 80 psi at any point in the system.
- Via boom spray. This should be done in damp conditions or followed by irrigation. Higher water rates (400L/ha+) need to be used in the absence of irrigation to wash the product into the soil. In boom sprays the pressure should not exceed 45 psi or 3 bar. Filters should be 50 mesh or larger.
- Via liquid/water injection.

Once mixed, must be used within 24 hours. Reseal immediately after use.

This product is distributed by a certified Metagen agronomist. Consult with your agronomist for specific application instructions for your crop. Ideal timing, rates and method of application can vary across systems.
