INFILTRATE CHALLENGE

Soil Aerator for Hydrophobic Soils

Infiltrate Challenge is a biological soil softener and aerator. It addresses water infiltration problems and eliminates water logging. It also increases nutrient exchange and improves nitrogen and oxygen permeability. Infiltrate Challenge assists hydrophobic soils by breaking down wax residue. The organic surface-active agents in Infiltrate Challenge enable water to penetrate into heavy clay soils and impermeable sands.

1L 5L 20L 1000L

SHAKE CONTAINER WELL PRIOR TO USE

Infiltrate Challenge is ideal in heavy clays, impermeable sands, non absorbing soils and water logged soils. It alters the anionic bonding to loosen soil allowing better air and water penetration.

DIRECTIONS

Apply Infiltrate Challenge at a rate of 300ml/ha.

It must be diluted with at least 50 parts water. It is best applied through irrigation systems and can be used 2–3 times during the year.

Your agronomist can advise you of other application method options. It is fully biodegradable and residue free.

COMBINATION TREATMENT

Infiltrate Challenge is a remedial product and formulated for short term use to address infiltration problems.

To prevent infiltration problems from reoccurring, use the Metagen soil biology that is formulated for your crop type.

Infiltrate Challenge should be applied in its own pass, not in same mix as Metagen Digestor NP, Digestor Challenge, Evergreen, Evergrow NP or Green Carbon Activate.

This product is distributed by a certified Metagen agronomist. Consult with your agronomist for specific application instructions for your crop. Ideal timing, rates and method of application can vary across systems.
